

### Hook 1: High-Energy Shoulder

Predicts a shoulder in the 20-100 keV range. This is important for the hook: requires a statistical preference of  $\Delta \text{BIC}(\text{shoulder} \text{ vs. } \text{cutoff PL}) \geq 6$ .

### Hook 2: Lag Hardening

Time lags increase with energy ( $d\log \tau / d\log E > 0$ ) across X-ray

### Hook 3: X-Ray Polarization

Angle  $\approx$  Equator ( $\pm 15^\circ$ )

X-ray polarization angle must be consistent with the equatorial plane, within approx.  $\pm 15^\circ$ .

DegreeTendstoRise

The degree of polarization tends to rise with energy.
