

# Hook 1: High-Energy Shoulder

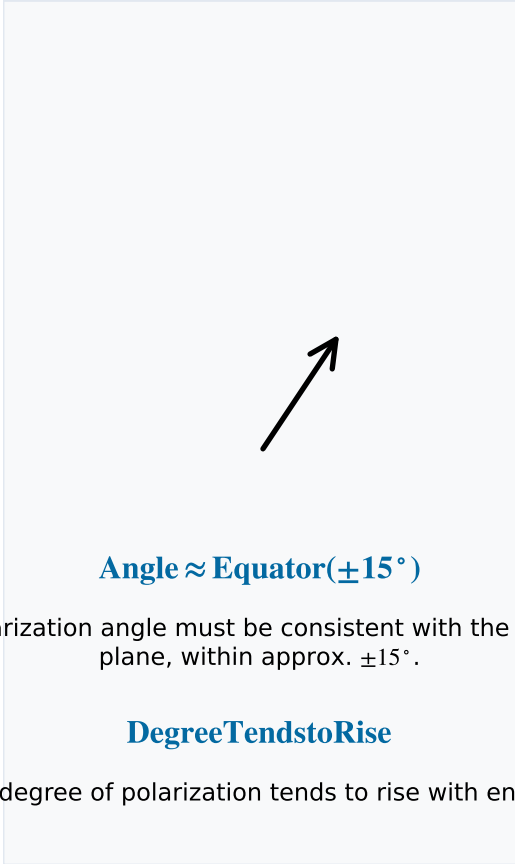

Shoulder expected in the 20-120 keV band. Quantitative hook:  
 $\Delta BIC \geq 6$  (shoulder vs. cutoff-PL)  
over a standard continuum.

# Hook 2: Lag Hardening

Lag increases with energy ("lag hardening"). X-ray polarization angle must be consistent with the equatorial plane, within approx.  $\pm 15^\circ$ .  
Schematic trend expected from the model;  
 $\frac{d \text{lag}}{d \log E} > 0$  across X-ray bands  
evaluated against a baseline continuum.

# Hook 3: X-Ray Polarization

Angle  $\approx$  Equator ( $\pm 15^\circ$ )

DegreeTendstoRise

The degree of polarization tends to rise with energy.
