

# Hook 1: High-Energy Shoulder

Shoulder expected in the 20-120 keV band. Quantitative hook:  
 $\Delta BIC \geq 6$  (shoulder vs. cutoff-PL)  
over a standard continuum.

# Hook 2: Lag Hardening

Predicts lag hardening: an energy-dependent trend where lags increase with energy ( $d \log \tau / d \log E > 0$ ) across X-ray bands, rather than a simple reprocessing echo.

# Hook 3: X-Ray Polarization

**Angle  $\approx$  Equator ( $\pm 15^\circ$ )**

X-ray polarization angle must be consistent with the equatorial plane, within approx.  $\pm 15^\circ$ .

**Degree Tends to Rise**

The degree of polarization tends to rise with energy.
