

Hook 1: High-Energy Shoulder

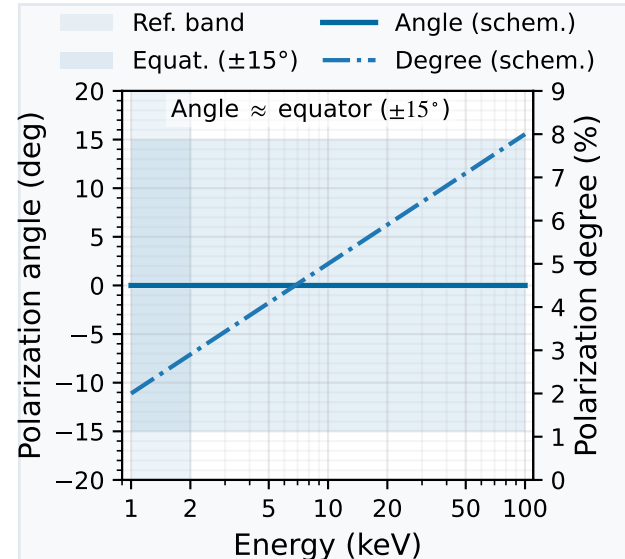

Shoulder expected in the 20–120 keV
 $\Delta\text{BIC} \geq 6$ (shoulder vs. cutoff-PL)
 over a standard continuum.

Hook 2: Lag Hardening

Lag increases with energy ("lag hardening").
 Schematic trend expected from the model;
 $\frac{d\text{lag}}{d\log E} > 0$ across X-ray bands
 evaluated against a baseline continuum.

Hook 3: X-Ray Polarization

X-ray polarization angle is
 consistent with the equatorial plane.
 Schematic expectation: angle within $\pm 15^\circ$;
 polarization degree tends to rise with energy,
 relative to a mechanism-agnostic baseline.
