

Hook 1: High-Energy Shoulder

Shoulder expected in the 20–120 keV band. Quantitative hook:
 $\Delta\text{BIC} \geq 6$ (shoulder vs. cutoff-PL)
over a standard continuum.

Hook 2: Lag Hardening

Lag increases with energy ("lag hardening"). Schematic trend expected from the model;
 $\frac{d\text{lag}}{d\log E} > 0$ across X-ray bands
evaluated against a baseline continuum.

Hook 3: X-Ray Polarization

Angle \approx Equator ($\pm 15^\circ$)

X-ray polarization angle must be consistent with the equatorial plane, within approx. $\pm 15^\circ$.

DegreeTendstoRise

The degree of polarization tends to rise with energy.
