

Hook 1: High-Energy Shoulder

Predicts a shoulder in the 20–120 keV band. This is a quantitative hook: requires a statistical preference of $\Delta\text{BIC} \geq 6$ (shoulder vs. cutoff-PL)

Hook 2: Lag Hardening

Predicts lag hardening: an energy-dependent trend where lags increase with energy ($d\log \tau/d\log E > 0$) across X-ray bands, rather than a simple reprocessing echo.

Hook 3: X-Ray Polarization
