

## How It Works: A Spin-Regulated Feedback Loop

$$P_{\text{ext}} = P_{\text{eq}} + P_{\text{BZ}} + P_{\text{res}}$$

Total extracted power is the sum of equatorial, BZ, and residual power.

$$f_{\text{eq}} + f_{\text{BZ}} + f_{\text{res}} = 1$$

The fractional contributions sum to unity.

An equatorial, unipolar-induction spin-extraction channel taps the black hole's rotational energy and re-injects a finite share into the disk, creating a self-sustained yet self-limiting cycle.
